

National security leaders are facing a critical challenge: they can't afford to fall behind in AI, but they also can't risk breaking the systems, data, and infrastructure that missions depend on. The pressure to adopt AI is real, yet most solutions require costly "rip and replace" approaches or introduce vendor lock in, putting ecosystem control, interoperability, and mission integrity at risk. Not being able to trust, integrate, and act on that data in time leads to delayed decisions, operational blind spots, and increased mission exposure.

The challenge isn't just adopting AI, it's doing it without compromising what already works.

Helix is an agentic AI orchestration tool that connects disparate and fragmented data sources, tools, and applications into clear, actionable intelligence. Built by Two Six Technologies and deployed in Top Secret environments, Helix delivers real-time, trusted decision advantage without forcing you to choose between innovation and mission assurance.

## Helix is the intelligent orchestrator that provides value from Day One. Don't build the engine. Pilot the mission.

### Core Features

Helix integrates seamlessly into existing systems with zero migration and unlocks AI-driven speed and insight while preserving data sovereignty and operational stability.

- **Interoperable AI:** Helix adapts to your infrastructure, not the other way around. Helix works across legacy, classified, and modern systems, without forcing users to adapt to a proprietary ontology or data schema.
- **Trusted Mission-Ready Deployment:** Helix does not require any existing software or hardware and operates in NIPR and TS environments. It is already deployed inside the IC, where it is actively saving thousands of man-hours, reducing operational risk, and accelerating time to decision.
- **Unparalleled Intelligence:** Helix is an iterative solution built in the field and engineered for what's next. Helix uses knowledge from the Two Six Technologies portfolio of mission focused software and DoW and IC customer feedback to provide an intuitive, chat-based experience.
- **Own Your Intelligence, No Vendor Lock-In:** Unlike other commercial AI platforms that require costly and risky data migration into proprietary silos, Helix connects to your existing data repositories and model APIs via MCP servers that you own. Your data stays where it is; our agents go to the data.

For a demo of **HELIX** or to purchase via GSA FEDSIM or the AWS ICMP:
